“ At **1.31 billion people** globally, PWD [people with disabilities] represent nearly one person in five on the planet – a market the size of China.”
– 2016 Global Economics of Disability Annual Report

In the United States,
there are over **56 million**
people with a disability.

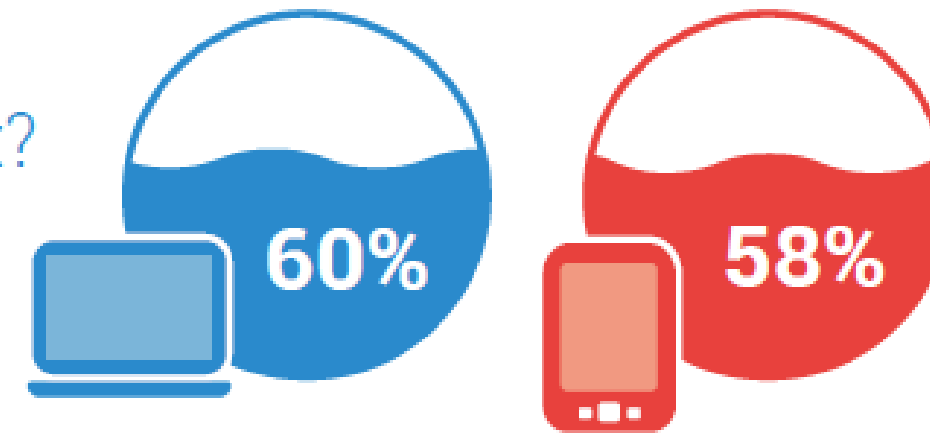

Types of Disability as defined by the US Census:

Hearing: **11.4 million**
Vision: **7.7 million**
Cognitive: **15.5 million**
Ambulatory: **21.2 million**
Self-Care: **8.1 million**
Independent Living: **14.4 million**

How do people with disabilities use the internet?

More than **60%** of people with disabilities in the US own a computer and **58%** own a smartphone.

Many people with disabilities use some form of **Assistive Technology** to navigate their computers and mobile devices. Some examples are:

Screen Readers Software that reads out content to the user and allows them to navigate via keyboard shortcuts

Keyboard-Only Navigation Users who can't operate a mouse due to visual or motor impairment need to be able to navigate entirely by keyboard. Likewise, alternative input devices like sip-and-puff or single switch buttons are emulating keyboard-style input.

Screen Magnification Software or hardware tool that magnifies the screen to extreme levels for people with low vision

Dictation Software Allows people who have trouble with computer input devices but are able to speak to navigate by voice.
